Syntax-Based Decoding 2

Philipp Koehn

5 April 2016

flashback: syntax-based models

Synchronous Context Free Grammar Rules

Nonterminal rules

$$NP \rightarrow DET_1 NN_2 JJ_3 \mid DET_1 JJ_3 NN_2$$

Terminal rules

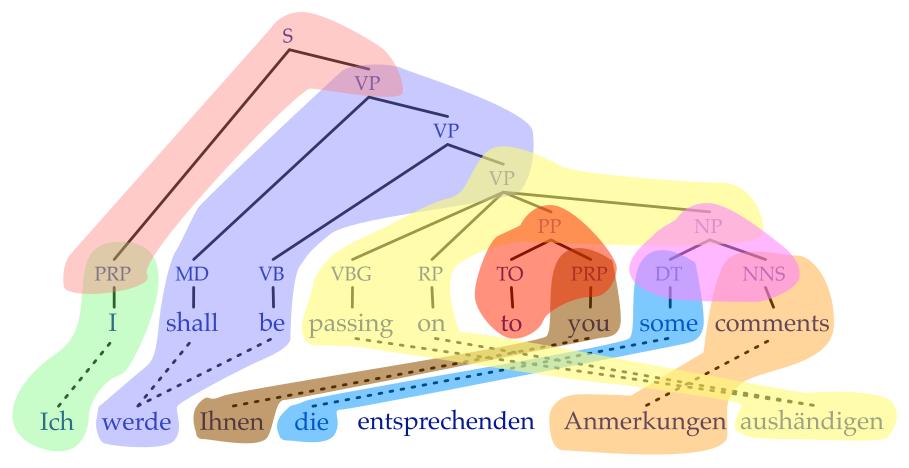

$$N o maison \mid house$$
 NP $o la maison bleue \mid the blue house$

Mixed rules

$$NP \rightarrow la \ mais on \ JJ_1 \mid \ the \ JJ_1 \ house$$

Extracting Minimal Rules

Extracted rule: $S \rightarrow X_1 X_2 \mid PRP_1 VP_2$

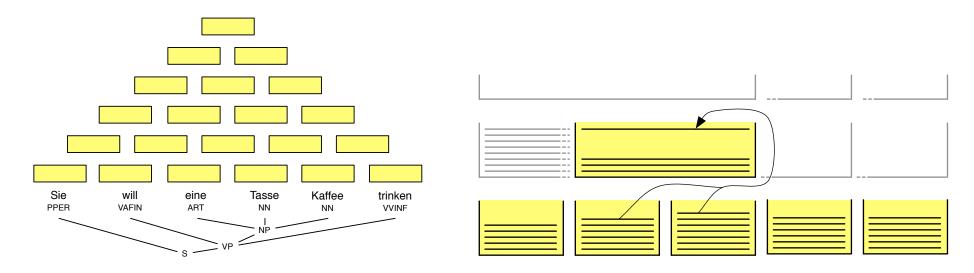

DONE — note: one rule per alignable constituent

flashback: decoding

Chart Organization

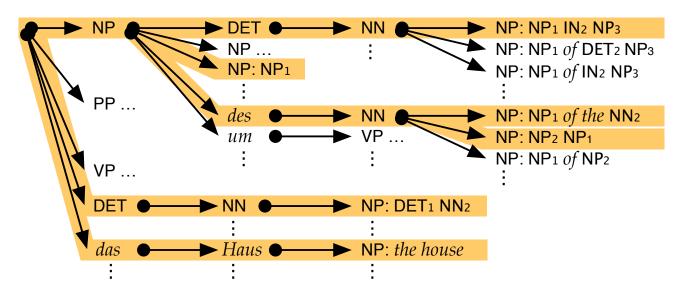

- Chart consists of cells that cover contiguous spans over the input sentence
- For each span, a stack of (partial) translations is maintained
- Bottom-up: a higher stack is filled, once underlying stacks are complete

Prefix Tree for Rules

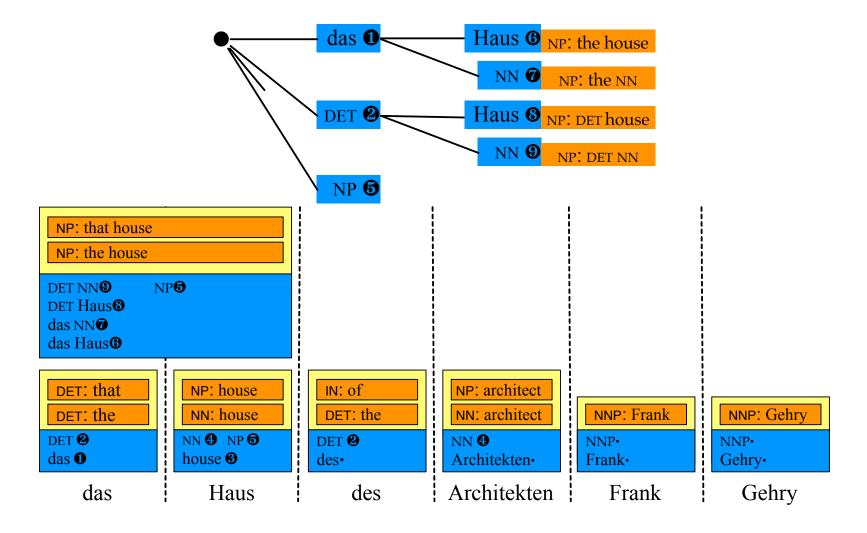

Highlighted Rules

CYK+ Parsing for SCFG

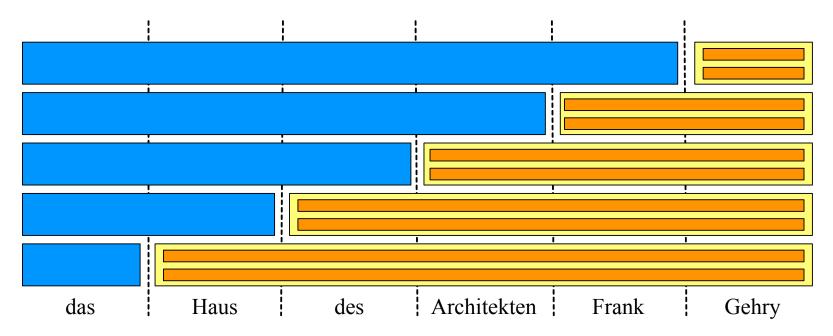

Processing One Span

Extend lists of dotted rules with cell constituent labels

span's dotted rule list (with same start)
plus neighboring
span's constituent labels of hypotheses (with same end)

pruning

Where are we now?

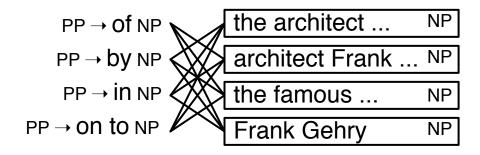

- We know which rules apply
- We know where they apply (each non-terminal tied to a span)
- But there are still many choices
 - many possible translations
 - each non-terminal may match multiple hypotheses
 - \rightarrow number choices exponential with number of non-terminals

Rules with One Non-Terminal

Found applicable rules $PP \rightarrow des X \mid ... NP ...$

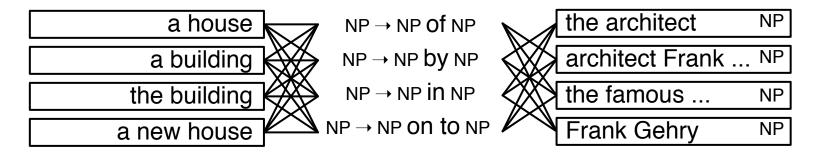

- Non-terminal will be filled any of *h* underlying matching hypotheses
- Choice of t lexical translations
- \Rightarrow Complexity O(ht)

(note: we may not group rules by target constituent label, so a rule NP \rightarrow des X | the NP would also be considered here as well)

Rules with Two Non-Terminals

Found applicable rule NP \rightarrow X₁ des X₂ | NP₁ ... NP₂

- Two non-terminal will be filled any of *h* underlying matching hypotheses each
- Choice of t lexical translations
- \Rightarrow Complexity $O(h^2t)$ a three-dimensional "cube" of choices

(note: rules may also reorder differently)

Cube Pruning

a house 1.0
a building 1.3
the building 2.2
a new house 2.6

a new house 2.6

Arrange all the choices in a "cube"

(here: a square, generally a orthotope, also called a hyperrectangle)

More of the Same

a house 1.0 2.1 2.5 3.1 a building 1.3 2.7 2.4 3.0 the building 2.2 a new house 2.6 3.8 3.8 a new house 2.6

- Hypotheses created in cube: (0,1), (1,2), (2,1), (2,0)
- Hypotheses in chart cell stack: (0,0), (1,0), (1,1)

Queue of Cubes

- Several groups of rules will apply to a given span
- Each of them will have a cube
- We can create a queue of cubes
- ⇒ Always pop off the most promising hypothesis, regardless of cube

• May have separate queues for different target constituent labels

Bottom-Up Chart Decoding Algorithm

- 1: for all spans (bottom up) do2: extend dotted rules
- 3: **for all** dotted rules **do**
- 4: find group of applicable rules
- 5: create a cube for it
- 6: create first hypothesis in cube
- 7: place cube in queue
- 8: end for
- 9: **for** specified number of pops **do**
- 10: pop off best hypothesis of any cube in queue
- add it to the chart cell
- 12: create its neighbors
- 13: end for
- 14: extend dotted rules over constituent labels
- 15: end for

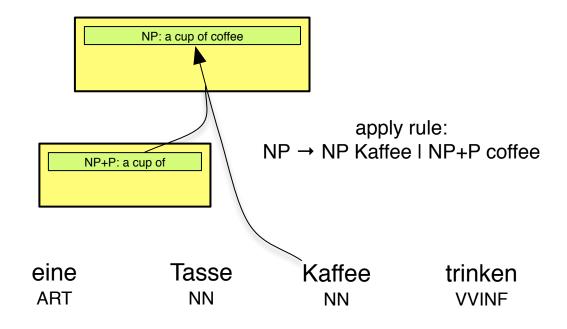

recombination and pruning

Dynamic Programming

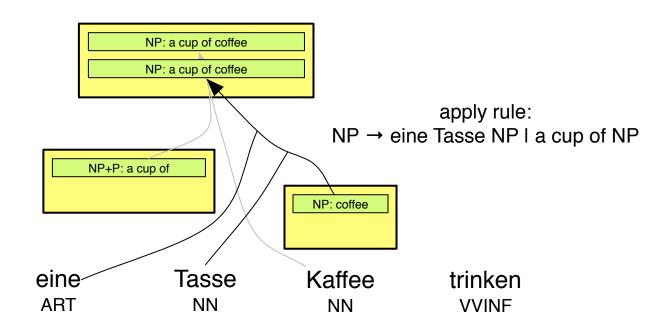

Applying rule creates new hypothesis

Dynamic Programming

Another hypothesis

Both hypotheses are indistiguishable in future search → can be recombined

Recombinable States

Recombinable?

NP: a cup of coffee

NP: a cup of coffee

NP: a mug of coffee

Recombinable States

Recombinable?

NP: a cup of coffee

NP: a mug of coffee

Yes, iff max. 2-gram language model is used

Recombinability

Hypotheses have to match in

- span of input words covered
- output constituent label
- first *n*–1 output words

not properly scored, since they lack context

• last *n*–1 output words

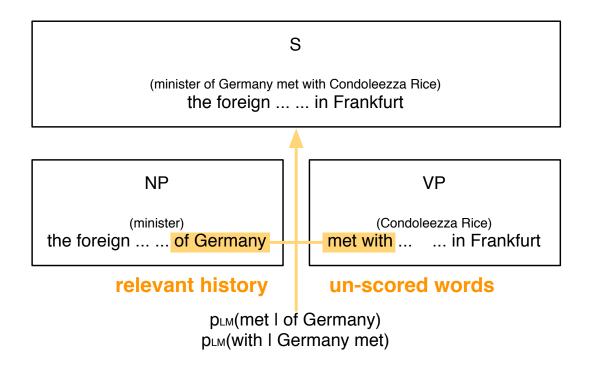

still affect scoring of subsequently added words, just like in phrase-based decoding

(n is the order of the n-gram language model)

Language Model Contexts

When merging hypotheses, internal language model contexts are absorbed

Stack Pruning

- Number of hypotheses in each chart cell explodes
- ⇒ need to discard bad hypotheses e.g., keep 100 best only
 - Different stacks for different output constituent labels?
 - Cost estimates
 - translation model cost known
 - language model cost for internal words known
 - \rightarrow estimates for initial words
 - outside cost estimate?
 (how useful will be a NP covering input words 3–5 later on?)

scope 3 pruning

How Often Does a Rule Apply?

Lexical rule → only once in sentence

$$NP \rightarrow la maison bleue \mid the blue house$$

One non-terminal bounded by words → only once in sentence

$$NP \rightarrow la NN_1 bleue \mid the blue NN_1$$

• One non-terminal at edge of rule \rightarrow non-terminal can cover O(n) words

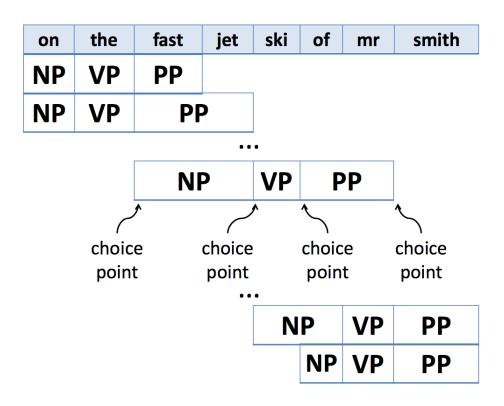

$$NP \rightarrow la NN_1 \mid the NN_1$$

• Two non-terminals at edges \rightarrow combined choices for both non-terminals $O(n^2)$

$$NP \rightarrow DET_1$$
 maison $JJ_2 \mid DET_1 JJ_2$ house

Choice Points

- 4 choice points $\rightarrow O(n^4)$ application contexts
- Too many choice points → rule applied to many times

Recall: Hierarchical Rule Extraction

- Having only one non-terminal symbol X
- Restrictions to limit complexity
 - at most 2 nonterminal symbols
 - no neighboring non-terminals on the source side
 - span at most 15 words (counting gaps)
- \Rightarrow At most 2 choice points ("scope 2")

Rule Binarization

- Convert grammar to Chomsky Normal Form (CNF) scope 3
- Only allow two types of rules $A \rightarrow word$ $A \rightarrow B C$

(Note: for our rules, we would allow additional terminals)

• Convert rules with more non-terminals

$$\begin{array}{c} \mathsf{A} \to \mathsf{X} \; \mathsf{Y} \; \mathsf{Z} \\ \Downarrow \\ \mathsf{A} \to \mathsf{X} \; \mathsf{Q} \\ \mathsf{Q} \to \mathsf{Y} \; \mathsf{Z} \end{array}$$

(Q is a new non-terminal, specific to this rule)

- But:
 - increases the number of non-terminals ("grammar constant")
 - can be tricky for SCFG rules

Scope 3 Pruning

- Remove all rules with scope > 3
- Less restrictive than CNF e.g., allows:

 $A \rightarrow DET_1$ maison JJ_2 sur la $NN_3 \mid DET_1 JJ_2$ house on the NN_3

(2 choice points at edges)

• Better speed/quality trade-off than synchronous binarization

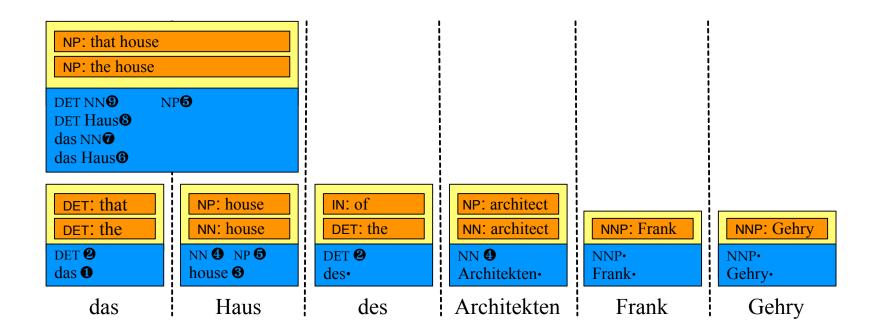

recursive cky+

• Two charts: (1) hypothesis chart, (2) dotted rule chart

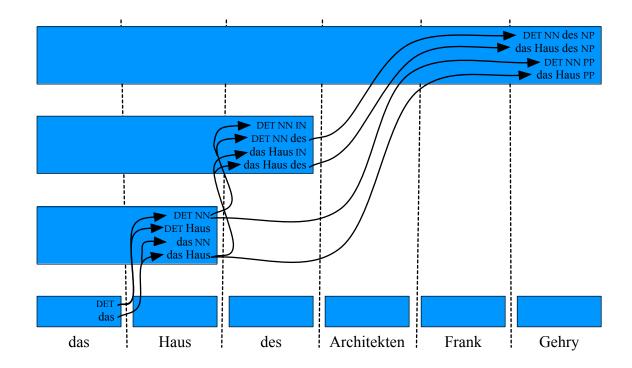

• Dotted rule chart allows dynamic programming of rules with same prefix

Expansion of Dotted Rules

Dotted rules are expanded recursively

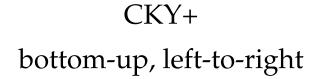

• Dotted rules are stored with each chart cell

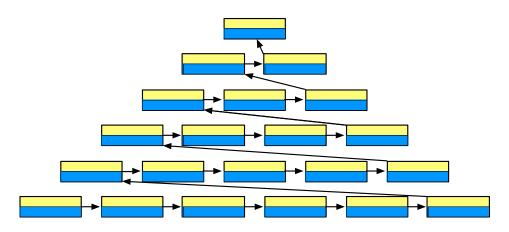

Recursive CKY+

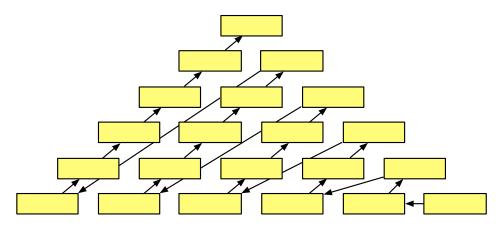

- Recursive CKY+ (Sennrich, 2014) removes need for dotted rule chart
- Chart traversal is re-arranged

recursive CKY+ right-to-left, depth-first

with dotted rule chart

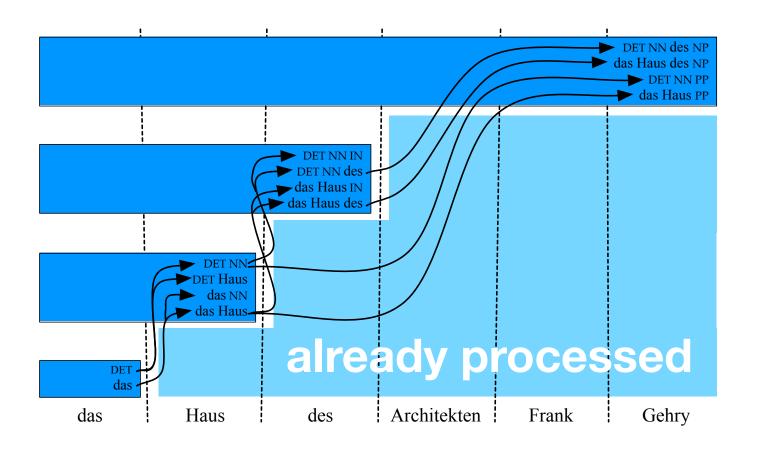

without dotted rule chart

Recursive CKY+

- Rule expansion by recursive function calls
- Rules can be immediately expanded, because all needed cells already processed

search strategies

Two-Stage Decoding

- First stage: decoding without a language model (-LM decoding)
 - may be done exhaustively
 - eliminate dead ends
 - optionably prune out low scoring hypotheses
- Second stage: add language model
 - limited to packed chart obtained in first stage
- Note: essentially, we do two-stage decoding for each span at a time
 - stage 1: find applicable rules
 - stage 2: cube pruning

Coarse-to-Fine

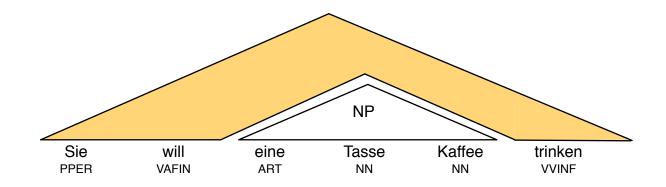

• Decode with increasingly complex model

- Examples
 - reduced language model [Zhang and Gildea, 2008]
 - reduced set of non-terminals [DeNero et al., 2009]
 - language model on clustered word classes [Petrov et al., 2008]

Outside Cost Estimation

- Which spans should be more emphasized in search?
- Initial decoding stage can provide outside cost estimates

• Use min/max language model costs to obtain admissible heuristic (or at least something that will guide search better)

Open Questions

- What causes the high search error rate?
- Where does the best translation fall out the beam?
- How accurate are LM estimates?
- Are particular types of rules too quickly discarded?
- Are there systemic problems with cube pruning?
